

Extracting interpretable signatures of whole-brain dynamics through systematic comparison

ANNIE G. BRYANT

THE UNIVERSITY OF
SYDNEY

Why should we consider **venturing beyond standard metrics** for quantifying brain activity from structural and/or functional neuroimaging?

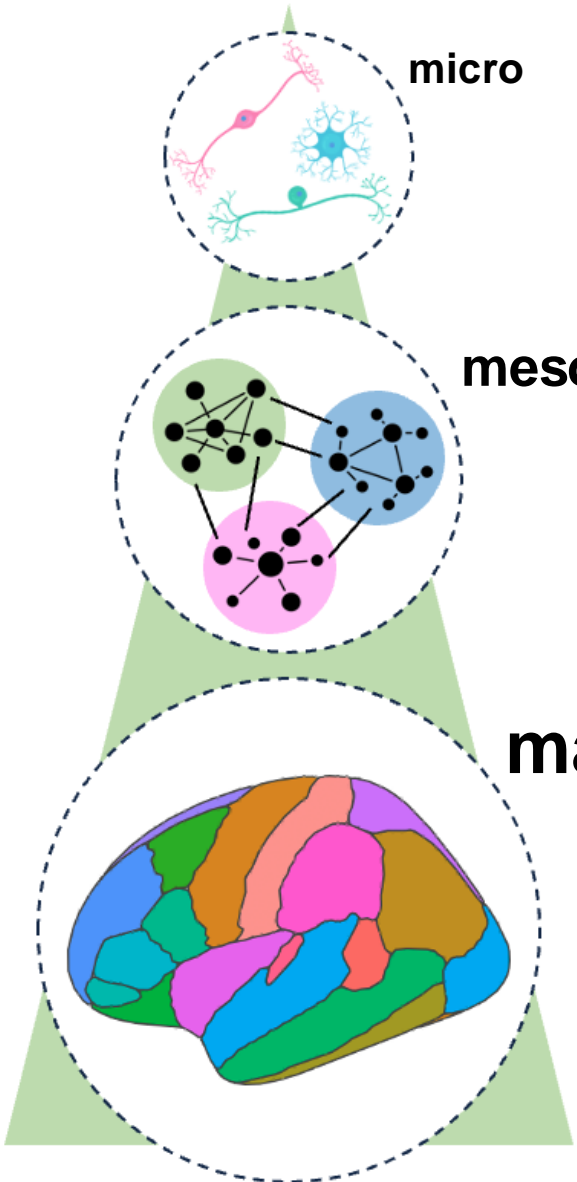

Brain dynamics can be measured at multiple scales

Multivariate time series (MTS)

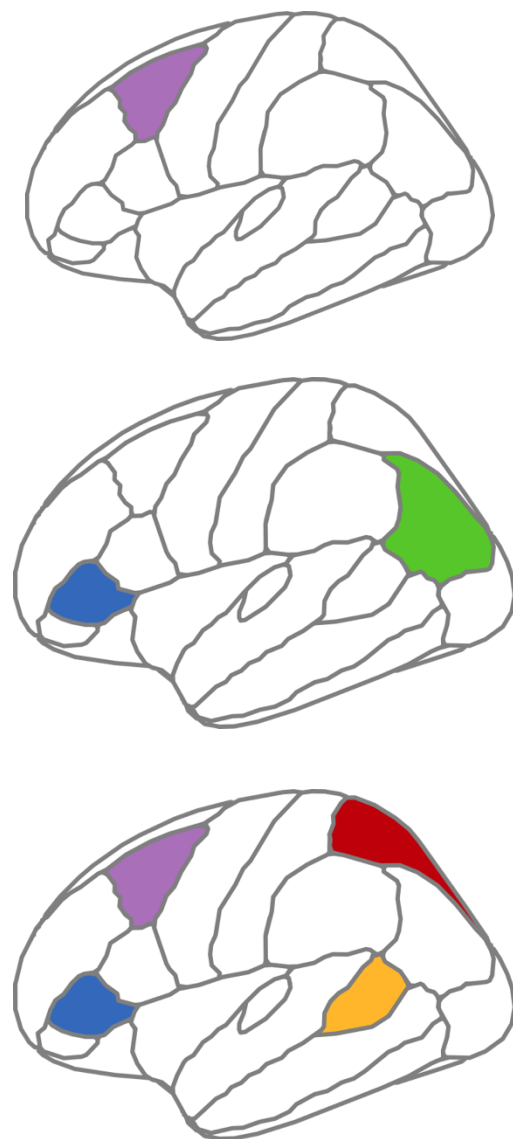

Brain dynamics can be measured at multiple scales

Multivariate time series (MTS)

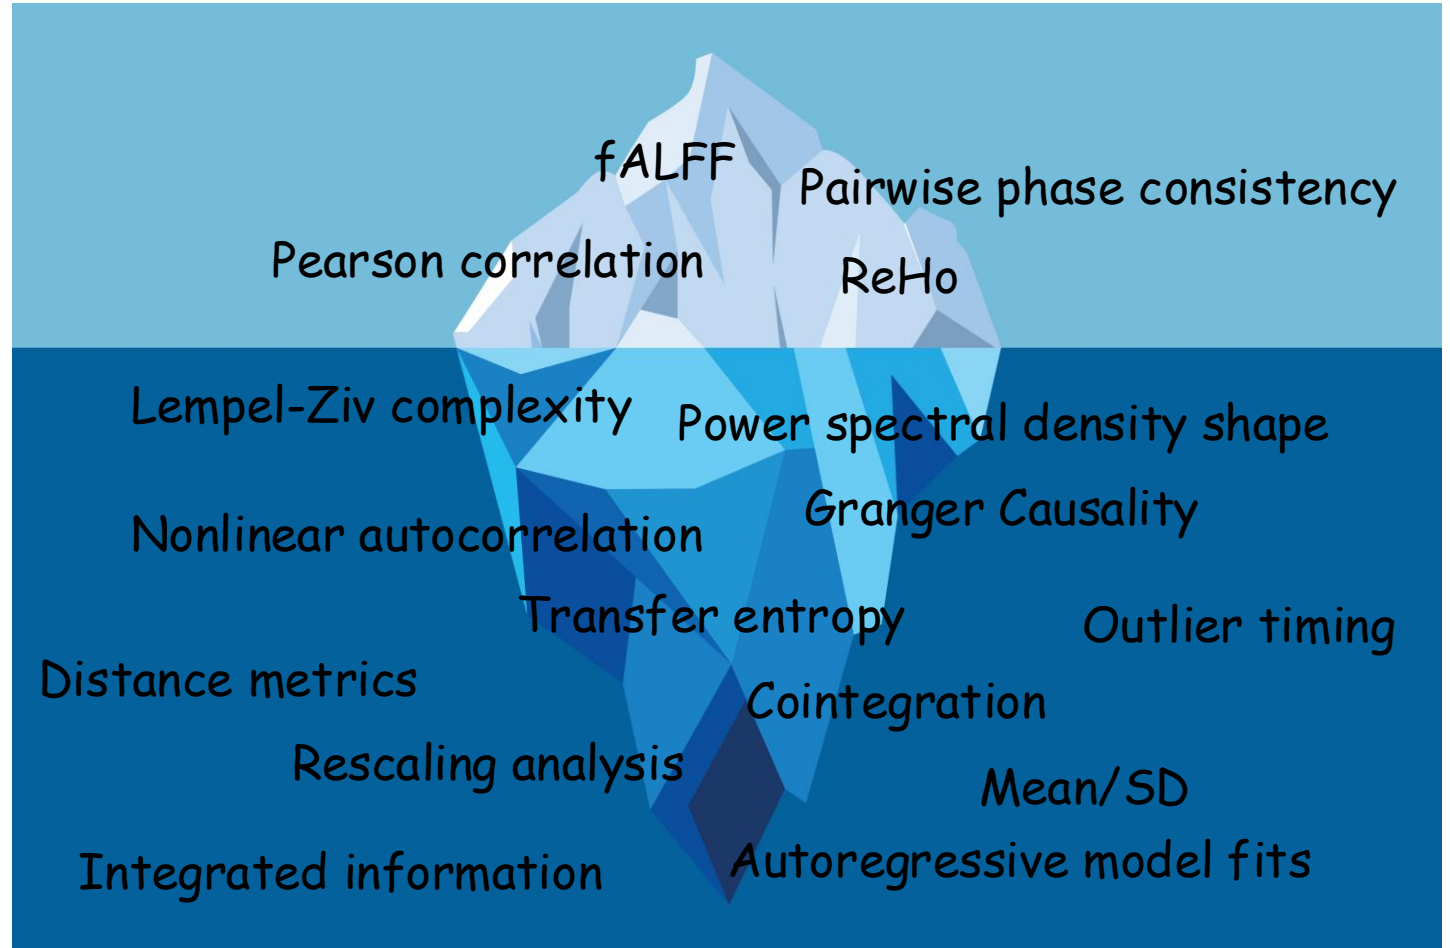

Brain dynamics can be measured at multiple scales

Multivariate time series (MTS)

How might we begin to **quantify** brain dynamics?

The brain is a complex system of great biological interest

Multivariate time series (MTS)

City structure

City properties: density, traffic patterns, crime rates, culture

Economics

National economy: economic growth, recession

Physics

Fluid dynamics: vortices, turbulence

Social networks

Facebook friends: community formation

What does this generalized representation offer us?

Multivariate time series (MTS)

Localized dynamics of one process

data distribution data values	correlation properties autocorrelation automutual information power spectral properties time-series entropy fluctuation analysis
model fitting linear autoregressive & nonlinear models model parameters goodness of fit	others stationarity embedding dimension network properties

- Fulcher et al. *J R Soc* (2013), *Cell Systems* (2017)
- Lubba et al. *Data Mining and Knowledge Discovery* (2019)

Statistical dependencies between pairs of processes

Basic (21 SPIs) Covariance Kendall's tau Cross-correlation ...		Distance similarity (26 SPIs) Distance correlation Heller-Heller-Gorfine test Dynamic time warping ...		Causal indices (10 SPIs) Additive noise models Convergent cross-mapping ...	
Information theory (37 SPIs) Mutual information Transfer entropy Integrated information ...		Spectral (126 SPIs) Coherence magnitude Directed coherence Spectral Granger causality ...		Miscellaneous (17 SPIs) Linear model fits Cointegration Envelope correlation ...

How can this systematic method be applied in a **comprehensive** yet **interpretable** way to real functional neuroimaging problems?

Case study: classifying neuropsychiatric disorders

i. Local dynamics in an individual region

ii. Whole-brain maps of an individual feature

iii. Whole-brain maps of all features

iv. FC across all region pairs with one SPI

v. FC across all region pairs by SPI plus all whole-brain maps of local dynamics

Source: scikit-learn

Linear support vector machine (SVM)

- Balanced accuracy
- Inverse probability weighting

× 10-fold CV
× 10 repeats

Bryant et al. *bioRxiv* (2024)

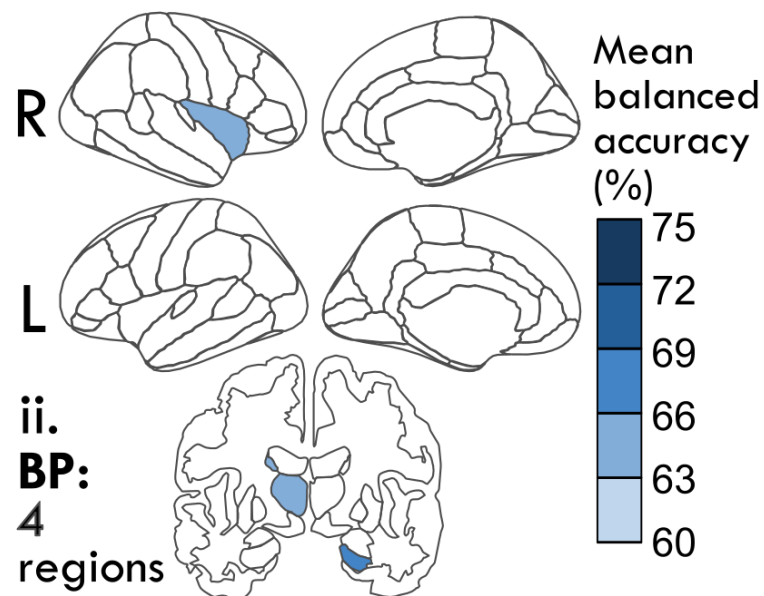

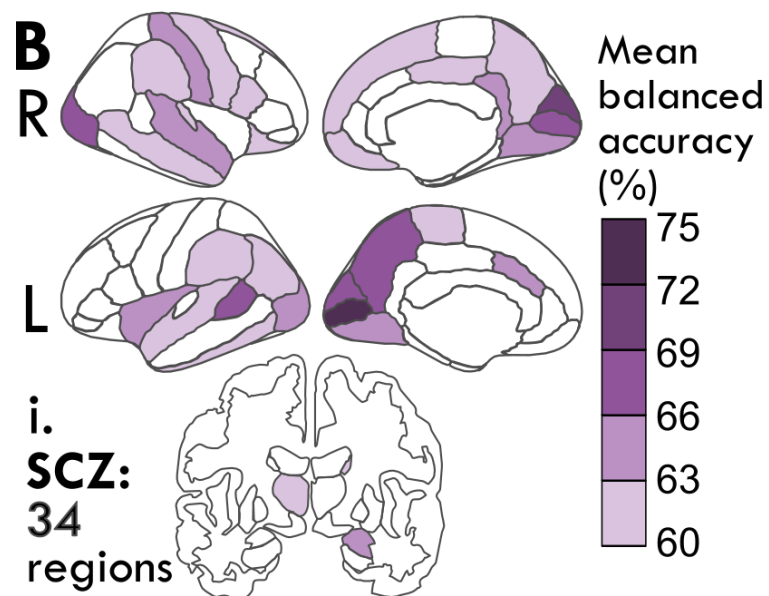

Data preprocessed by Traut et al. *NeuroImage* (2022)

Data preprocessed by Kevin Aquino & Linden Parkes

Interpretable spatial maps of region-specific dysfunction

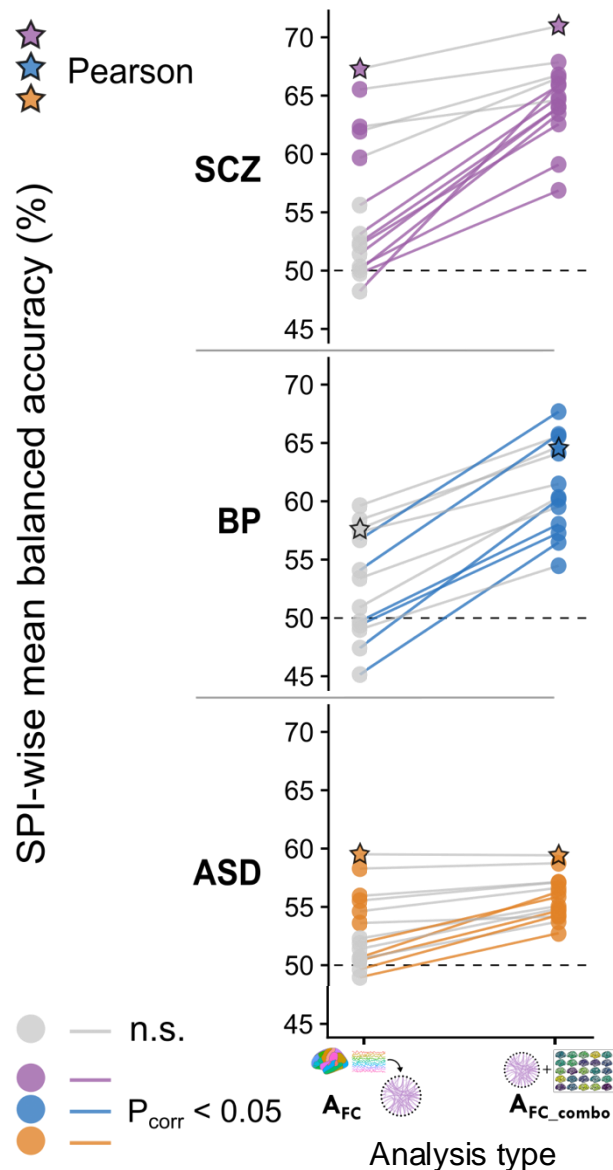

Dynamical signatures of resting-state activity in **individual brain regions** can distinguish patients from controls in schizophrenia and bipolar disorder

- Gene expression
- Anatomical changes
- Stimulation analysis

Bryant et al. *bioRxiv* (2024)

The benefit of **integrating** local dynamics and pairwise coupling

iv. FC across all region pairs with one SPI

pyspi

+

iii. Whole-brain maps of all features

Most pairwise **functional connectivity** metrics are more informative with the inclusion of **brain-wide maps of local regional dynamics**, and the **Pearson correlation coefficient** is the top performer

Bryant et al. *bioRxiv* (2024)

What other types of neuroimaging-focused insights can this comprehensive approach offer?

Quantifying properties inter-areal coupling to evaluate competing hypotheses of consciousness
